[ABSTRACT] Objective: To observe the efficiency of enalapril combing with levamlodipine on type 2 diabetes complicated with hypertension. Methods: The treatment group was treated with enalapril combing with levamlodipine, while the control group was treated with levamlodipine alone for 6 weeks. Changes in blood pressure and serum creatinine, urine protein were observed and compared. Results: Both groups showed decrease in blood pressure, but significant more obvious in the observation group (P<0.05). Conclusions: Enalapril combing with levamlodipine shows obvious effects on type 2 diabetes complicated with hypertension.
